Itoh N, Kavanaugh WM;

WPI; 2001-343823/36.

New nucleic acid molecule useful for treating disease, e.g. infertility, impotence, or testicular cancer.

Claim 17; Page 39; 61pp; English.

The present sequence represents an epitope-bearing portion of human fibroblast growth factor-21 (FGF-21). FGF proteins regulate growth and differentiation of a variety of cell types. FGF-21 mucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the thymus

The present invention describes an active variant (1) of a fibroblast growth factor (FGF) having at least one mutation in the beta-8-beta-9 loop, having enhanced specificity for one receptor subtype compared to the corresponding wild type FGF, by decreasing the biological activity mediated by at least one receptor subtype while retaining the activity conscipation another receptor subtype. (1) has cytostatic, vulnerary, consteppathic and antiatritric activities. (1) can be used as a regulator of vasculogenesis or angiogenesis. (1) is useful for preparing a medicament and for treating a disease or disorder related to normal or medicament and for treating a disease or disorder related to normal or commance bone fracture healing or bone growth processes and wound healing processes. (1) is useful in detection and treatment of various FGFR related disorders including skeletal disorders e.g. achondroplasia, or processes (1) is useful in detection and treatment of various FGFR related disorders including skeletal disorders e.g. achondroplasia, or processes (1) is useful in detection and cartilage defects, multiple myeloma, epithelial cancers such as transitional cell carcinoma of the bladder and cervical carcinoma. The novel mutants are useful in high companies in various disorders such as skeletal disorders and sarve as template for the formation of improved agonists and an earner cannon cannon and an analysis and mits and the serve as template for the formation of improved agonists and carries and manner cannon and the cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon cannon can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes the protein and coding sequences of thuman fibroblast growth factor (FGF) 19 homologue FGF19%, the former which is shown here. The sequences can be used in the prognosis and treatment of proliferative diseases such as cancer, restenosis, psoriasis, rheumatoid arthritis and Dupuytren's contracture, as well to stimulate cell growth for treating neurological disorders such as Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                  Human; fibroblast growth factor 19; FGF19X; embryonic development; proliferative disorder; cancer; restenosis; psoriasis; rheumatoid arthritis; Dupuytren's contracture.

Novel isolated fibroblast growth factor-like polypeptide useful for treating, preventing or ameliorating cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, diabetes, obesity, stroke and

Claim 14; Page 116-117; 138pp; English

The sequence represents a fragment of a fibroblast growth factor-like (FGF-like) polypeptide. FGF-like protein and its associated nucleic acid play a role in modulating body growth, maturation or life-span. They are also useful for treating, preventing or ameliotating disorders such as cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, diseases, damage to renal tubules as a result of acute tubular necrosis, haematopoietic cell reconstitution following chemotherapy, wasting syndromes (e.g., cancer associated cachexia), damage to the corneal of premature maturation, alopecia, abnormalities of androgen target organs, cather element dissues, androgen target organs, bronchopilmonary dysplasia, acute respiratory distress syndrome, tumours of the eye or other tissues, atherosolerosis, hypercholesterolemia, stroke, osteoporosis, osteoarthritis, muscle atrophy, sarcopenia, baldness, wrinkles, increased fatigue, decreased stamina, decreased baldness, wrinkles, increased fatigue, decreased stamina, decreased cardiac function, immune system dysfunction, cancer, Parkinson's disease, senile dementia, Alzheimer's disease, and decreased cognitive function

Conklin DC, Chen Z;

WPI; 2001-441880/47. N-PSDB; AAD09151. Novel rFGF11 polypeptide and polynucleotide, a member of fibroblast growth factor family, for stimulating proliferation of mesenchymal, osteoblastic lineage cells and treating diabetes, obesity, osteoporosis,

Claim 1; Page 63; 69pp; English.

The present sequence is human fibroblast growth factor (FGF) homologue, CC zFGF11 protein. zFGF11 game is located on chromosome 19. zFGF11 is useful for stimulating proliferation of mesenchymal cells, osteoblastic lineage cells. zFGF11 is useful for identifying chromosomal disorders associated with abnormal expression of zFGF11 protein. zFGF11 is also useful for stimulation, inhibition or proliferation of myocytes, smooth muscle cells adipocytes, chondrocytes, neural tube-derived stem cells, neural cells and neuronal progenitors, pancreatic cells, prostate-derived cells and neuronal progenitors, pancreatic cells, prostate-cesus resences, restenced sand obseity. Stimulation of osteoblasts catheroscierosis, restenced and obseity. Stimulation of osteoblasts catheroscis and other deficiencies in bone structure and formation. zFGF11 is useful for treating disorders associated with diabetes costeoprosas and other deficiencies in bone structure and formation. ZFGF11 is useful for treating disorders associated with diabetes costeoprosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal differentiation and congenital disorders of the companies of neuronal development, promoting angiogenesis and wound healing, for revascularisation in eye, complications related to poor circulation such as diabetic food ulcers, improving cardiac correduce damage to the tissue caused by isohemia or ischaemia-reperfusion events, particularly in the heart or brain and for inducing skeletal muscle neogenesis and/or hyperplasia, kidney regeneration and/or for

```
The invention relates to one hundred and twenty two nucleic acids canceding PRO polypeptides. The sequences of the 122 PRO polymucleotides encoding PRO polypeptides. The PRO nucleic acids, polypeptides, and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in periorte cells, for simulating the proliferation or differentiation of chondrocyte cells, for simulating the release of tumour necrosis factor-alpha from human blood, for stimulating the release of tumour necrosis factor-alpha from human blood, fibroblast cells. The PRO polypeptide may also be used as molecular of fibroblast cells. The PRO polypeptide may also be used as molecular applications in molecular biology, including use as hybridisation probes, and in chromesome and gene mapping. Au033592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Mature fibroblast growth factor homologue, zFGF11. This sequence is specifically claimed in claim 4"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             growth factor; FGF; zFGF11; mesenchymal cell; FGFRIIIc;
             related disorder and for diagnosing tumors such
useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, fibroblast growth factor, FGF; zFGF11; mesenchymal cell; FGFRII: osteoblastic lineage cell; diabetes mellitus; neuropathy; neural development; amyotrophic lateral sclerosis; cerebrovascular stroke; neuronal differentiation; congenital disorder; nervous system disorder; cardiac function; wound healing.

The present invention relates to new extracellular messenger polypeptides and polymucleotides encoding them. XMES is useful in the diagnosis, and polymucleotides encoding them. XMES is useful in the diagnosis, are treatment and prevention of neurological disorders (e.g. epilepsy, extroke, or Alzheimer's disease), autoimmune/inflammatory disorders (e.g. acquired immune deficiency syndrome, AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), endocrine disorders (e.g. hypophysectomy, or cushing's syndrome), and call proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous or compounds on the expression of nucleic acid and amino acid sequences of compounds on the expression of nucleic acid and amino acid sequences of viral, bacterial, fungal, parasitic, processal and helminthic infections, trauma, disorders associated with hypopituitarism, continually the infections, trauma, disorders associated with hypopituitarism, continually parasitic disorders such as type II diabetes mellitus. The xMES may be used for somatic or germline gene therapy. The present
                                                                                                                    New extracellular messenger polypeptides and polynucleotides encoding them, useful for diagnosing, treating or preventing e.g. neurological, autoimmune, inflammatory, developmental and endocrine disorders.
                                                                                                                                                                                                                                                                            claim 1; Page 111; 123pp; English.

The invention relates to an isolated human polypeptide (1) for zFGF11 (a fibroblast growth factor), and the encoding polynucleotide (II). (I) and (II) are used in methods of the invention stimulating proliferation of mesenchymal cells, detecting the presence of zFGF11 in a biological sample, detecting the presence of zFGF11 in a biological sample, detecting the presence of sFGF11 in a biological sample, stimulating proliferation of osteoblastic lineage cells. The polypeptides, nucleic acid and/or antibodies of the invention may be used in treatment of disorders associated with diabetes mellitus, neural cell development or degeneration, anyotrophic lateral sclerosis, development or degeneration, anyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of cerebrovascular stroke, neuropathy associated with lack of maintenance of cerebrovascular stroke, neuropathy associated with lack of maintenance of cerebrovascular development. Molecules of the invention may also be useful for improving cardiac function and for promoting wound healing of the epidezmis. The present sequence represents the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                      Isolated polypeptide for zFGFI1 (fibroblast growth factor) useful in treatment of disorders associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral sclerosis,

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnostis and treatment of tumoure. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0739-ABUB0860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the
One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating

The invention describes an isolated mucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide cilloation; or the full length coding sequence of any these 122 mucleotide sequences. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour, or liver tumour, prostate tumour, rectal tumour, or liver tumour, or liver tumour, or simulating the proliferation or differentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating configuration of pericyte cells, or for modulating colypeptides are useful in drug screening, particularly as targets or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets or the transperior of the presence of these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome conference of these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome conference of these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome conference of these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome conference of these diseases. The PRO genes may gereening libraries of human cDNA, genond cDNA or mRNA. The PRO genes may exceening libraries are useful as novel human secreted and conservation and sequence of a novel human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

Treating a mammal exhibiting Type 2 diabetes or Type 1 diabetes or obesity, by administering composition comprising fibroblast growth factor
                                                                                                                                                                                              encoding movel human secreted and transmembrane (PRO) polypeptides. The produing novel human secreted and transmembrane (PRO) polypeptides. The pRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromesome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; fibroblast growth factor 21; FGF-21; chromosome 19; 19q13.1-qter; diabetes; obesity; antidiabetic; anorectic; type 2 diabetes;
                                                                            One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal.
                                                                                                                                                                                     The invention describes one hundred and eighty seven nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human fibroblast growth factor 21 protein SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 86; DB 6; I

The present sequence represents human fibroblast growth factor 21 (FGF-21). FGF-21 is located to chromosome 19, more specifically to 19q13.1—CG qter. The present invention describes a method for treating a mammal exhibiting type 2 diabetes or type 1 diabetes, or treating a mammal combisition type 2 diabetes or type 1 diabetes, or treating a mammal for obesity which comprises administering to the mammal a composition comprising FGF-21 which has at least 95% amino acid sequence identity to the 208 amino acid sequence given in ABP96156. Also described: (1) administering FGF-21 to induce an increase in glucose uptake in adipocyte cells by administering FGF-21 to induce an increase in glucose uptake, and (2) administering a medicament for treating type 1 diabetes, type 2 diabetes or obesity in a mammal using FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 has antidiabetic and anorectic activities. The method is useful for treating a mammal for obesity. The method is preferably useful for treating twee 1 or type 2 diabetes, and for treating domestic animals for obesity. The method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the animals for obesity the method is preferably the treating domestic animals for obesity the method is preferably the method is preferably the method is preferably the method and preferably the method is preferably the method is preferably the method is preferably the method is preferably the method is preferably the preferably the method is preferably the preferably the method is preferably the method is preferably the method is preferably the method is preferably the method is preferably the preferably the preferably the preferably the preferably the preferably the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in perforce cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Godowski PJ;

New PRO protein encoding nucleic acid, useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumor in a mammal

The invention relates to an isolated nucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate thil length PRO cDNA. The PRO polypeptides are useful for chondrocyte stimulation, TNF-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of tumour in an mammal. The PRO colypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO antibodies are useful in diagnostic assays for pro an affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents the amino acid sequence of a human secreted/transmembrane PRO polypeptide

Claim 11; Fig 78; 324pp; English

The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention

                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for the reduction of mortality and morbidity in critically ill patients, which involves the and morbidity in critically ill patients, which involves the daministration of fibroblast growth factor 21 (FGF-21) (I). (I) has critically independent immunosuppressive, continifiammatory, antibacterial, immunosuppressive, vasotropic, haemostatic and aphrotropic activities, and can be used as a glucose level regulator, a glucose uptake stimulator, and an insulin continity enhancer. (I) can be used in the manufacture of a medicament of for the reduction of morbidity and mortality in critically ill patients suffering from systemic inflammatory response syndrome (SIRS), confering from systemic inflammatory response syndrome (SIRS), confering from systemic inflammatory sepais and chronic obstructive pulmonary disease (e.g. emphysema and chronic broncitie).

The SIRS includes pancreatitis, ischaemia, multiple trauma and tissue (failure. FGF-12 regulates Shock, immune-mediated organ injury, shock and renal calidestion; affects the overall metabolic state and counter-acts negative side effects that occur during the body's stress response to sepsis; reduces morbidity and mortality that occurs in critically ill patients; and stimulates glucose uptake and enhances insulin sensitivity. The present sequence represents the human FGF-21 amino acid sequence, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of fibroblast growth factor 21 for reduction of mortality and morbidity in parients suffering from e.g. systemic inflammatory response syndrome and acute respiratory distress syndrome.
                                                                                                                                                                                                                             mortality; morbidity; fibroblast growth factor 21; FGF-21; antiinflammatory; respiratory; antibacterial; immunosuppressive; vasotropic; haemostatic; nephrotropic; glucose level regulator; glucose uptake stimulator; insulin sensitivity enhancer; systemic inflammatory response syndrome; respiratory distress; acute lung injury; acute respiratory distress syndrome; multiple organ dysfunction syndrome; sepsis; chronic bronchitis; chronic obstructive pulmonary disease; emphysema; chronic bronchitis; pancreatitis; ischaemia; multiple trauma; tissue injury; haemorrhagic shock; immune-mediated organ injury; shock; renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 86; DB 7; Length 208; 100.0%; Pred. process. Income succession by the control of the control of the pharmaceutical and diagnostic agents, such as in the blocking of receptor sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the mammal. In addition, they may be useful for measuring or detecting the expression of a tumour in a manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate prolypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gerritsen ME, Goddard A, Godowski PJ;

LINGHIGH OIL URBGILDER AN INDUATED KNO (SECTEFEG AND ITABIREMEDIZABLE)

DOLYPEPTIGE (II) PRO982, PRO1160, PRO1187 PRO1239 polypeptide are
useful for stimulating the proliferation of or gene expression in
perioque cells. PRO357, PRO329, PRO1272 or PRO4405 polypeptide are useful
for stimulating the proliferation of differentiation of chondrocyte
cells. PRO231, PRO357, PRO752, PRO1185, PRO1180 or PRO1419 polypeptide
are useful for stimulating the release of tumour necrosis factor (INF)-
alpha from human blood. PRO982, PRO531, PRO155, PRO136, PRO1419, PRO1149,
PRO137, PRO126, PRO1166, PRO1167, PRO1077, PRO1411, PRO1411,
PRO159, PRO1181, PRO1166, PRO1197, PRO1197, PRO1411, PRO1412,
PRO1266, PRO1370, PRO347, PRO1166, PRO1373, PRO1379, PRO1374, PRO13139,
PRO1867, PRO1376, PRO1387, PRO1409, PRO1474, PRO1917, PRO1160, PRO1387,
PRO1867, PRO1368, PRO1387, PRO1409, PRO1474, PRO1917, PRO1461, PRO1367,
PRO1867, PRO6363, PRO1801, PRO1404, PRO4333, PRO5444, PRO6322,
PRO9404, PRO6393 or PRO10056 polypeptide are useful for
stimulating the proliferation of normal human dermal fibroblasts cells.
PRO181, PRO229, PRO188, PRO1194, PRO1272, PRO1488, PRO4302, PRO4408,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Goddard A, Godowski PJ;

pro5723, PRO5725, PRO7154, or PRO7425 polypeptide are useful for inhibiting the proliferation of normal human dermal fibroblast cells. PRO polypeptides such as PRO6004, PRO4981, PRO7174, PRO5778, PRO4332, etc., are useful for detecting the presence of tumour in a mammal which involves comparing the level of expression of the above PRO polypeptides involves comparing the level of expression of the above PRO polypeptides of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polyuncleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful corremanting useful for treating bone and/or cartilage disorders (e.g., arthritis, sueful for treating bone and equence of a human secreted and

invention describes an isolated PRO (secreted and transmembrane)

Claim 11; Fig 78; 305pp; English

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (1). PRO982, PRO116) PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

CC for stimulating the proliferation of dindrocyte

cells. PRO231, PRO125, PRO1305 or PRO4405 polypeptide are useful

CC for stimulating the proliferation or differentiation of chondrocyte

cells. PRO337, PRO525, PRO1305 or PRO1499 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)
are useful for stimulating the release of tumour necrosis factor (TMF)
calpha from human blood. PRO982, PRO3131, PRO1905, PRO1130,

PRO132, PRO134, PRO136, PRO1065, PRO1093, PRO9141, PRO1411,

PRO126, PRO130, PRO136, PRO1905, PRO1909, PRO1141, PRO1309,

```
The invention describes an isolated RPO (secreted and transmentally polypeptide are polypeptide (I). PRO982, PRO1167 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in the proliferation of differentiation of chondrocyte (I). PRO357, PRO229, PRO1305 or PRO4405 polypeptide are useful for stimulating the proliferation of differentiation of chondrocyte (I). PRO317, PRO725, PRO1305 or PRO1419, polypeptide are useful for stimulating the release of tumour necrosis factor (TMP). The release of tumour necrosis factor (TMP). The release of tumour necrosis factor (TMP). PRO1305, PRO1305, PRO1305, PRO1306, PRO1419, PRO1309, PRO1305, PRO1305, PRO1306, PRO1305, PRO1306, PRO1305, PRO1306, PRO1306, PRO1305, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1307, PRO1306, PRO1306, PRO1306, PRO1307, PRO1306, PRO1306, PRO1307, PRO1306, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1306, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1307, PRO1306, PRO1307, PRO1307, PRO1306, PRO1307, PRO1306, PRO1307, PRO1307, PRO1306, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307, PRO1307

CR C Stimulating the proliferation of normal human dermal fibroblasts cells.

CR PRO529, PRO7184, or PRO7455 polypeptide are useful for detecting the presence of tumour in a mammal which in a test sample of cells taken from the mammal, and a control sample of normal cells of the presence of tumour in the mammal, and a control sample of tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or tumour, or as theramantic prostate tumour, in the mammal or the properior of tumour, prostate tumour, rectal tumour or the properior of tumour prostate tumour, in the mammal or the properior of tumour prostate tumour, in the properior of tumour or the properior of tumour prostate tumour, in the properior of tumour or tumour or tumour or tumour or the properior of the properior
                                                                                                                                                                  Human; secreted and transmembrane protein; PRO; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; chondrocyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF)-alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; lissue typing; chromosome mapping; gene mapping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gerritsen ME, Goddard A, Godowski PJ;

ö,
for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of or gene chondrocyte cells of for stimulating the proliferation of or gene normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromsome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New PRO polypeptides and nucleic acids encoding the polypeptides, useful e.g. in gene therapy, disease diagnosis, chromosome identification and

technology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.

Claim 11; Fig 78; 308pp; English.

Novel isolated PRO polypeptide useful for tissue typing, gene therapy, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.

The invention describes an isolated PRO (secreted and transmembrane) polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in

pericyte cells. PRO357, PRO1229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO357, PRO355, PRO1355, PRO1365 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TMF) calpha from human blood. PRO982, PRO357, PRO3136, PRO1319, PRO1341, PRO1316, PRO1319, PRO1365, PRO1305, PRO1306, PRO1306, PRO1306, PRO1306, PRO1306, PRO1307, PRO1306, PRO1306, PRO1307, transmembrane PRO polypeptide.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynuclectides encoding them. The PRO polypeptides and polynuclectides are useful as pharmaceuticals, diagnostics, bioseness or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene cormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating technology, in generating transgenic animals which may be used in the development and screening of therapeutically useful reagents, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome matibodies, are useful for preparing medicament for treating a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the re-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated PRO polypeptides, useful for tissue typing, gene therapy, molecular weight markers in protein electrophoresis, and for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 11; Fig 78; 308pp; English.

                The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypeptides encoding them.

Transmembrane polypeptides) and the PRO polynucleotides encoding them. CC transmembrane polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumour, rectal tumour or liver tumour, breast tumour, rectal tumour or liver tumour, in a mammal, for stimulating the release of tumour necrosis factor (TNF) alpha from human constituting the proliferation of or gene chondrocyte cells, for stimulating the proliferation of or gene expression in perioyte cells or for stimulating the proliferation of or gene chondrocyte calls, for stimulating the proliferation of or gene choracyte cells in chromosome and gene mapping, in generating probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which reagents, in gene therapy, in chromosome and gene mapping, in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, such as perioyte-casociated tumours and bone and/or cartilage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as perioyte-casociated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the recondition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as perioyte-casociated tumours and bone and/or cartilage consociated an encourar markers from condition because else and in tissue typing. This conditions and howers for protein electrophoresis, and in tissue typing. This conditions the properties of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour. The timour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polymptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF)-alpha from human blood, for stimulating the proliferation or differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MI.

```
chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of cormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant cethmology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome antibodies, are useful for preparing a medicament for treating a mithodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartiage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour nerosis factor (TMF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene cormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating the chnology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a medicament for treating a medicament for treating a medicament for treating a medicament for treating a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO condition which is responsive to the PRO polypeptides or anti-properting and the properties or anti-properties or anti-properting and the properties or anti-properties                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antibodies, such as periorte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated PRO polypeptide useful for tissue typing, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.
                                                                                                                                                                                                                                       Godowski PJ;

ADC49828 standard; protein; 208 AA. RESULT 30 ADC49828

(first entry) 18-DEC-2003

ADC49828;

Novel human secreted and transmembrane protein PRO10196.

human; secreted and transmembrane protein; PRO; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; chondrocyte cell proliferation; tumour necrosis factor alpha release; (TNF) -alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour;

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

cuseful for stimulating the proliferation of or gene expression in

periopte cells. PRO357, PRO229, PRO1272 or PRO445 polypeptide are useful

cor stimulating the proliferation of differentiation of chondrocyte

cells. PRO231, PRO357, PRO7155, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNRF)
cells. PRO331, PRO356, PRO951, PRO3156, PRO1306, PRO1419, PRO1416,

the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour is lung liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polymoleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        release;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Goddard A, Godowski PJ;

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

useful for stimulating the proliferation of or gene expression in

Dericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

for stimulating the proliferation of differentiation of chondrocyte

cells. PRO357, PRO355, PRO135, PRO1306 or PRO1419 polypeptide

cells. PRO351, PRO555, PRO185, PRO1306 or PRO1419 polypeptide

cells. PRO317, PRO556, PRO351, PRO1525, PRO1306, PRO1419, PRO1419,

(GETH) GENENTECH INC.

Gerritsen ME, Goddard A, Godowski PJ; Smith V, Stephan JF, Watanabe CK, Wood WI; Baker KP, Desnoyers L, Grimaldi JC, Gurney AL,

WPI; 2003-801246/75. N-PSDB; ADC47149. New isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy.

Claim 11; Fig 78; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

COUNTY The PROSEZ, PRO1160, PRO1137 or PRO1329 polypeptide are

```
The invention describes an isolated PRO (secreted and transmembrane)

CD1ypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

CD2 polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

CD3 seeful for stimulating the pro11feration of or gene expression in

CD2 pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

CD3 stimulating the pro11feration or differentiation of chondrocyte

CD3 seculs. PRO357, PRO357, PRO1185, PRO1190 or PRO1419 polypeptide

CD3 alpha from human blood. PRO982, PRO357, PRO725, PRO1306, PRO1419, PRO140,

CD3 seculs. PRO3137, PRO526, PRO363, PRO537, PRO1244, PRO1141, PRO11309,

CD3 PRO1025, PRO1134, PRO1126, PRO1105, PRO1192, PRO1244, PRO1274, PRO1412,

CD3 PRO1025, PRO1330, PRO1347, PRO1306, PRO1131, PRO1339,

CD3 PRO1343, PRO338, PRO4341, PRO1409, PRO1414, PRO1317, PRO1326,

CD3 PRO1987, PRO338, PRO4341, PRO1801, PRO4331, PRO3444, PRO1327,

CD3 PRO9940, PRO6079, PRO9836 or PRO10096 polypeptide are useful for
                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gerritsen ME, Goddard A, Godowski PJ;

stimulating the proliferation of normal human dermal fibroblasts cells. PRO181, PRO229, PRO788, PRO1194, PRO1272, PRO1488, PRO4302, PRO4408, PRO5233, PRO5725, PRO7154, or PRO7425 polypeptide are useful for inhibiting the proliferation of normal human dermal fibroblast cells. PRO polypeptides such as PRO6004, PRO4981, PRO7174, PRO5778, PRO54332, etc., are useful for detecting the presence of tumour in a mammal which involves comparing the level of expression of the above PRO polypeptides in a test sample of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour colon timour in the properties. tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO255, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide. 8888888888888888888888888888

Gerritsen ME, Goddard / Smith V, Stephan JF,

One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody,

Claim 11; Fig 78; 314pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

to useful for stimulating the proliferation of or gene expression in

pericyte cells. PRO325, PRO225, PRO1272 or PRO4405 polypeptide are useful

cells. PRO331, PRO357, PRO225, PRO1355, PRO1366 or PRO1419 polypeptide

cells. PRO331, PRO355, PRO155, PRO1355, PRO1366 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)
alpha from human blood. PRO982, PRO351, PRO125, PRO1306, PRO1139,

PRO137, PRO337, PRO826, PRO1005, PRO195, PRO1304, PRO1411, PRO1140,

PRO1025, PRO1134, PRO136, PRO1305, PRO1174, PRO1311, PRO1411, PRO1309,

PRO1286, PRO1330, PRO1341, PRO1404, PRO1373, PRO1274, PRO1311,

PRO1887, PRO1376, PRO1387, PRO1409, PRO11474, PRO1374, PRO1316,

PRO1887, PRO1389, PRO4380, PRO1404, PRO1373, PRO1367,

PRO1887, PRO529, PRO788, PRO1184, PRO1174, PRO1367, PRO1867,

PRO1891, PRO5225, PRO7184, or PRO1405 polypeptide are useful for

comparing the proliferation of normal human dermal fibroblast cells. PRO189,

PRO5723, PRO5725, PRO7184, or PRO7425 polypeptide are useful for

comparing the proliferation of normal human dermal fibroblast cells. PRO180,

PRO5723, PRO5725, PRO7184, or PRO7425 polypeptide are useful for

comparing the proliferation of normal human dermal fibroblast cells.

colypeptides such as PRO6004, PRO4981, PRO7778, PRO4322,

PRO5723, PRO5725, PRO786, PRO6004, PRO4981, PRO7778, PRO4322,

are useful for detecting the presence of tumour in a mammal which

convolves comparing the level of expression of the above PRO polypeptides

involves comparing the test sample as command to endrol sample

control sample tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide.

New isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy.

Claim 11; Fig 78; 308pp; English.

The invertion describes an isolated PVO Secreted and Laismenbrane CC polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in periotyce cells. PRO357, PRO1259, PRO1250 or PRO4405 polypeptide are useful for stimulating the proliferation of or gene expression in for stimulating the proliferation or differentiation of chondrocyte cells. PRO351, PRO357, PRO1155, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood. PRO982, PRO357, PRO1081, PRO1306, PRO1419, PRO1419, PRO1414, PRO1314, PRO526, PRO357, PRO1081, PRO1080, PRO1086, PRO1414, PRO1367, PRO1085, PRO1181, PRO1367, PRO1086, PRO1377, PRO1180, PRO1377, PRO1180, PRO1378, PRO1377, PRO1180, PRO1378, PRO1377, PRO1379, PRO1379, PRO1387, PRO1387, PRO1379, PRO1379, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1387, PRO1881, PRO1387, PRO1388, PRO1387, PRO1388, The invention describes an isolated PRO (secreted and transmembrane)

(GETH) GENENTECH INC.

New isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy.

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO231, PRO357, PRO1155, PRO1155, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF)-alpha from human blood. PRO982, PRO357, PRO725, PRO1306, PRO1419, PRO214, The invention describes an isolated PRO (secreted and transmembrane) Claim 11; Fig 78; 309pp; English.

Novel isolated PRO polypeptide useful for tissue typing, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.

Claim 11; Fig 78; 308pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them. The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, colon tumour, breast tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) alpha from human blood, for stimulating the proliferation of or gene conditoryte cells, for stimulating the proliferation of or gene expression in perioyte cells or for stimulating the proliferation of conditoring probes, in chromosome and gene mapping, in generating contains the development and screening of therapeutically useful rechnology, in generating transgenic animals or knock-out animals which reagents, in gene therapy, and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome condition which is responsive to the PRO polypeptides, or anti-PRO antibodies, such as perioyre-associated tumours and bone and/or cartiage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as perioyre-associated tumours and bone and/or cartiage disorders (e.g. arthritis, sports injuries), involving inducing the re-condition of chondrocyte-associated tumours and bone and/or cartiage disorders (e.g. arthritis, sports injuries), involving inducing the re-condition of chondrocytes. The PRO polypeptides are useful as molecular markers a human PRO polypeptide of the invention.
